

A SERIES — SAFETY SUPPORT COMES STANDARD

The Hyster® Dynamic Stability System (DSS) is engineered into every A Series model, beginning with the H40-70A. Once you see how it supports safe operation, you'll know why no operation should settle for less than DSS.

LATERAL STABILITY SYSTEM

Reduces truck lean in turns, helping to improve lateral stability. The system is 100% maintenance-free, with no controller, sensors or wiring.

HIGH-LIFT TRACTION CONTROL

Limits truck speed when carriage is raised above the height threshold. Operator receives a visual indicator on the truck display and an audible alert.

HIGH-LIFT TILT CONTROL

Limits tilt speed and forward tilt range when the carriage is raised above the height threshold while carrying a load. Operator receives a visual indicator on the truck display and an audible alert.

CORNER CONTROL

Dynamically limits speed when driving around corners based on how tightly the truck is turning. Operator receives a visual indicator on the truck display and an audible alert.

EXPLORE THE H40-70A MODELS WITH DSS

Note: While the DSS system supports safe truck operation and helps the operator minimize the potential for tip overs, proper operation of the truck, including 100% full-time and proper utilization of the seatbelt, are the primary and best means of keeping the truck upright and operator safe. Refer to the operator manual and your forklift training program for proper operation.
